2024 Summer Course Week 1

Presenter: Pao-Hsun, Chen

Ubuntu 20.04.6 LTS iso download

Website:https://releases.ubuntu.com/focal/

Desktop image

The desktop image allows you to try Ubuntu without changing your computer at all, and at your option to install it permanently later. This type of image is what most people will want to use. You will need at least 1024MiB of RAM to install from this image.

64-bit PC (AMD64) desktop image

Choose this if you have a computer based on the AMD64 or EM64T architecture (e.g., Athlon64, Opteron, EM64T Xeon, Core 2). Choose this if you are at all unsure.

Ubuntu Installation

- sudo
- sudo apt update
- sudo apt upgrade
- sudo apt install <pkg>
- cd
  - Change Direcotry
- ls
  - List
- su -
- rm -rf <dir>
  - rm -rf /

Install Ubuntu 20.04 virtual machine (youtube.com)

https://www.youtube.com/watch?v=VGhx7WkSUH8

Docker Introduction

- docker pull
- docker build -t <image tag> .
- docker run <image tag>
- docker image ls
- docker container ls

Git Introduction

- git pull <git url>
- git commit
- git push

Local
Repository

Homework 1

Please train a model to classify [mnist dataset](#), and you must train your model in docker container [pytorch/pytorch](#).

- You must display your **test accuracy** and **your system name** in the screenshot.

Homework 2

Please solve these 2 problems with c++, and submit your code to your github repository.

- Find First and Last Position of Element in Sorted Array
- Longest Palindromic Substring
- Median of Two Sorted Arrays

You must commit your solutions, a screenshot of your result in your terminal and a document to explain your code, analyze the time complexity and descripe how to run your code than push your commit to your github repository.

About your solution file name, please follow the following patterns.

Pattern: Problem_<problem number>_sol

For example: Problem_1_sol.cpp

Problem 1. Find First and Last Position of Element in Sorted Array

Description:
 Given an array of integers nums sorted in non-decreasing order, find the starting and ending position of a given target value.If target is not found in the array, return [-1, -1]. You must write an algorithm with O(log n) runtime complexity.

Example 1:
Input: nums = [5,7,7,8,8,10], target = 8
Output: [3,4]

Example 2:
Input: nums = [5,7,7,8,8,10], target = 6
Output: [-1,-1]

Example 3:
Input: nums = [], target = 0
Output: [-1,-1]

Constraints:
- $0 <= nums.length <= 10^5$
- $-10^9 <= nums[i] <= 10^9$
- nums is a non-decreasing array.
- $-10^9 <= target <= 10^9$

Problem 2. Longest Palindromic Substring

Description:

Given a string s, return the longest palindromic substring in s.

Example 1:
Input: s = "babad"
Output: "bab"
Explanation: "aba" is also a valid answer.

Example 2:
Input: s = "cbbd"
Output: "bb"

Constraints:
- 1 <= s.length <= 1000
- s consist of only digits and English letters.

Problem 3. Median of Two Sorted Arrays

Description:

Given two sorted arrays nums1 and nums2 of size m and n respectively, return the median of the two sorted arrays.

The overall run time complexity should be O(log (m+n)).

Example 1:
Input: nums1 = [1,3], nums2 = [2]
Output: 2.00000
Explanation: merged array = [1,2,3] and median is 2.

Example 2:
Input: nums1 = [1,2], nums2 = [3,4]
Output: 2.50000
Explanation: merged array = [1,2,3,4] and median is (2 + 3) / 2 = 2.5.

Constraints:
- nums1.length == m
- nums2.length == n
- 0 <= m <= 1000
- 0 <= n <= 1000
- 1 <= m + n <= 2000
- -10^6 <= nums1[i], nums2[i] <= 10^6

Deadline: 8/8 23:59
